1. Makappi Support Documentation

Documentation for the Makappi onboarding and support team.

1.1 Table of Contents

1.1.1 [Getting started](#)

Overview of Makappi and its main features.

1.1.2 [Onboarding](#)

Step-by-step guide to set up a new client's app.

1.1.3 [Push Notifications](#)

How to send push notifications to app users.

1.1.4 [Integrations](#)

List of available third-party integrations.

1.1.5 [FAQ](#)

Frequently asked questions and troubleshooting.

1.2 Additional Resources

- **Website:** makappi.com
- **Support Website:** makappi.com
- **Shopify App Store:** [Makappi App](#)

2. Getting started

Makappi is a Shopify app that enables merchants to create native iOS and Android mobile apps for their stores.

2.1 What Makappi Does

- Native iOS and Android apps for Shopify stores
 - White-label platform: one codebase for multiple stores
 - No-code customization via visual editor
 - Automatic sync with Shopify data
-

2.2 Main Features

2.2.1 App Editor

- Drag & drop page builder
- Color and font customization
- Real-time preview
- Home screen variations

2.2.2 Marketing

- Banners and countdown timers
- Scheduled campaigns
- Deep linking

2.2.3 Checkout

- Apple Pay
- In-app checkout
- Pre-filled shipping information

2.2.4 Push Notifications

- Scheduled campaigns
- Abandoned cart notifications
- Wishlist reminders
- Rich notifications with images

2.2.5 Analytics

- Google Analytics
 - Facebook Analytics
 - Firebase Analytics
-

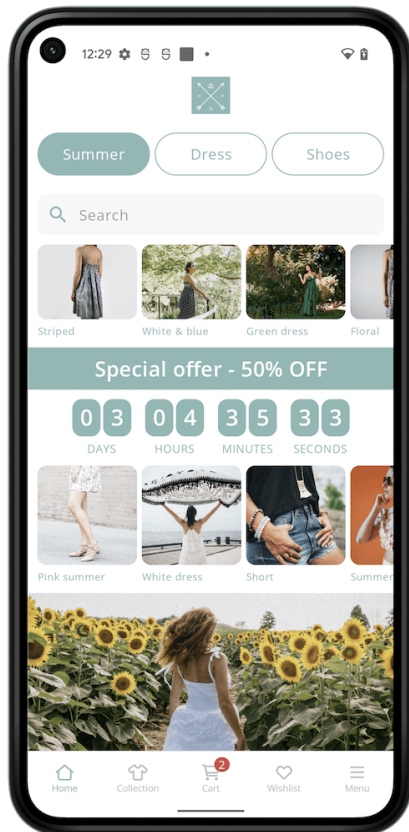

2.3 App Screens Overview

This section presents all the screens of a Makappi-generated mobile app.

2.3.1 Home

The home page is the main screen of the app. It's the first screen users see when they launch the app. It can display Collections, Products, and special offers. Multiple Home pages can be created using tabs at the top of the screen.

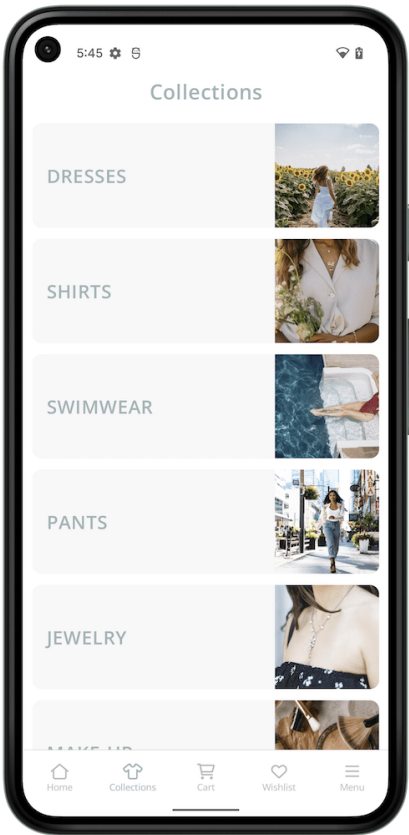

Backoffice: Design > Home

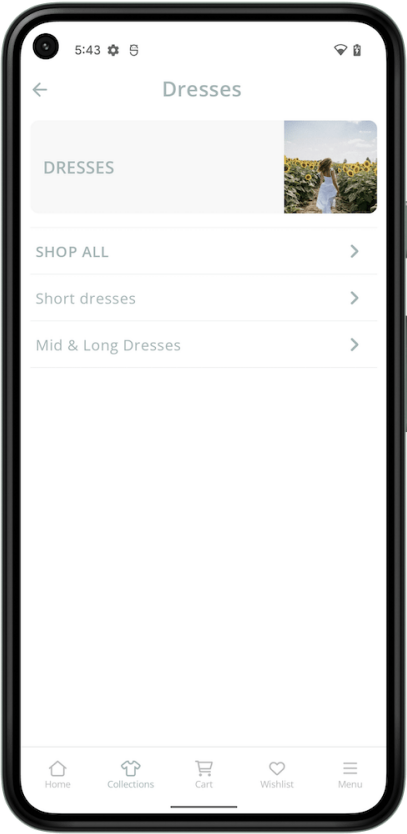

2.3.2 Collections

The Collections screen lets users navigate between categories and sub-categories to access products. Navigation is organized using Shopify Collections.

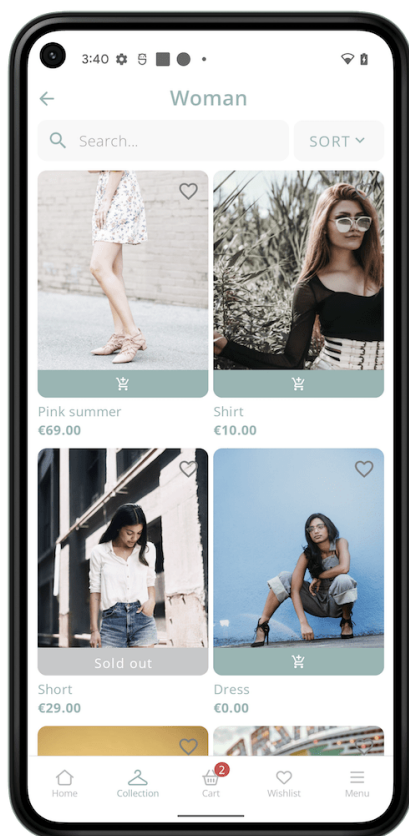

Backoffice: Design > Collections

2.3.3 Products List

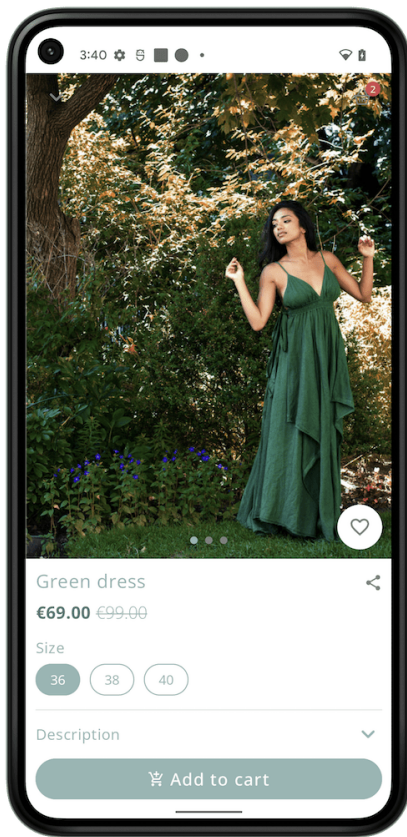

This screen shows all products from a Collection or Sub-Collection. Users can browse products quickly, filter them, and add them to cart with a tap.

2.3.4 Product Page

This screen shows all information about a Product: pictures, variations (sizes, colors, etc.), descriptions, technical info, and reviews.

Backoffice: Design > Product

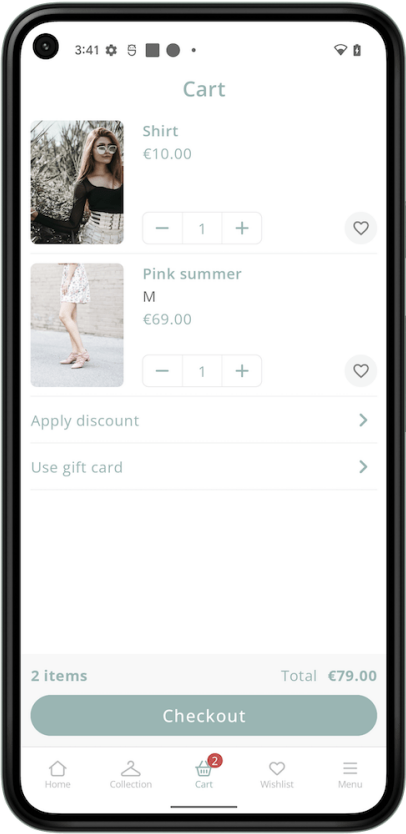

2.3.5 Favorites

The Favorites screen shows all products a user added to their favorites. Users can save products to buy later and quickly add them to cart.

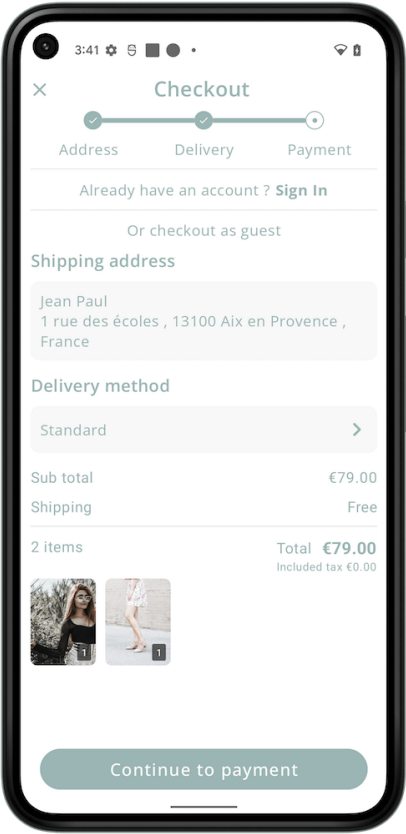

2.3.6 Shopping Cart

The shopping cart displays products added by the user. Users can update their choices (size, color, etc.), quantities, add a discount code, or use a gift card. Apple Pay lets iOS users confirm and pay with one tap.

2.3.7 Checkout

The checkout screen lets users enter their address (or retrieve it from their account), choose shipping options, and review their order.

2.3.8 Orders

The Orders screen shows all previous orders (including orders from the website). Users can access this screen from the app Menu.

3. Onboarding

Step-by-step guide to set up a new client's app.

3.1 1. Home Screen

The Home screen editor is located in **Design > Home**.

3.1.1 Logo

Adding a logo is **mandatory**. The logo image should be 440x80 pixels.

3.1.2 Building the Home Screen

The Home editor uses a drag and drop interface:

1. From the left menu, drag blocks into the preview area
2. Configure each block by clicking on it
3. When configuring blocks, you can choose to display Products or Collections. These are synchronized with Shopify, so you can see the actual products and collections from the shop.

3.1.3 Using Tabs

You can use Tabs to organize the Home screen into sections. This is useful for shops with distinct categories, for example a clothing store could have tabs for "Men", "Women", and "Kids".

3.1.4 Best Practices

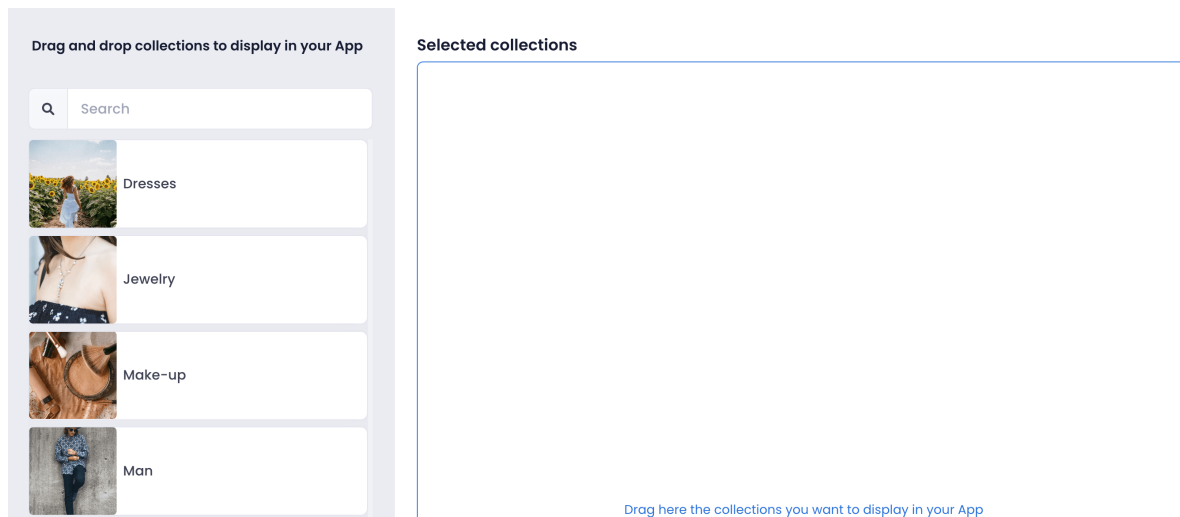

- **Replicate the web shop:** Start by duplicating the Home screen of the web version of the shop
 - **Fresh content at the top:** Add promotions or new collections at the top of the page so users see new content when they open the app
 - **Long pages are fine:** The Home page can be long. It's usually good for users to scroll through it like a feed
-

3.2 2. Collections

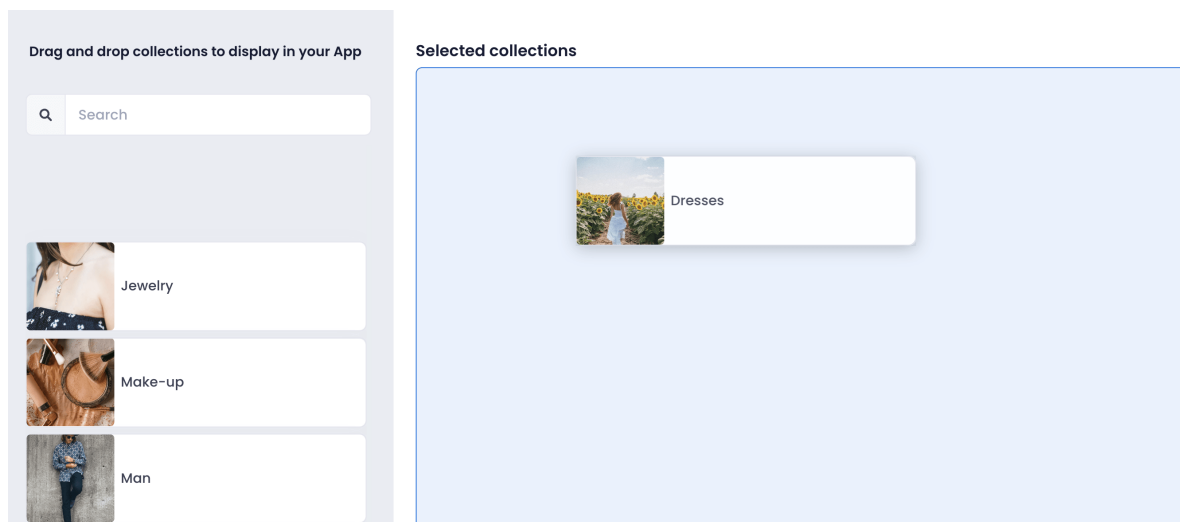

3.2.1 Configure your Collection Tree

The collection editor in "Design > Collections" of your Makappi space lets you configure the collection tree you want to display in your Mobile App.

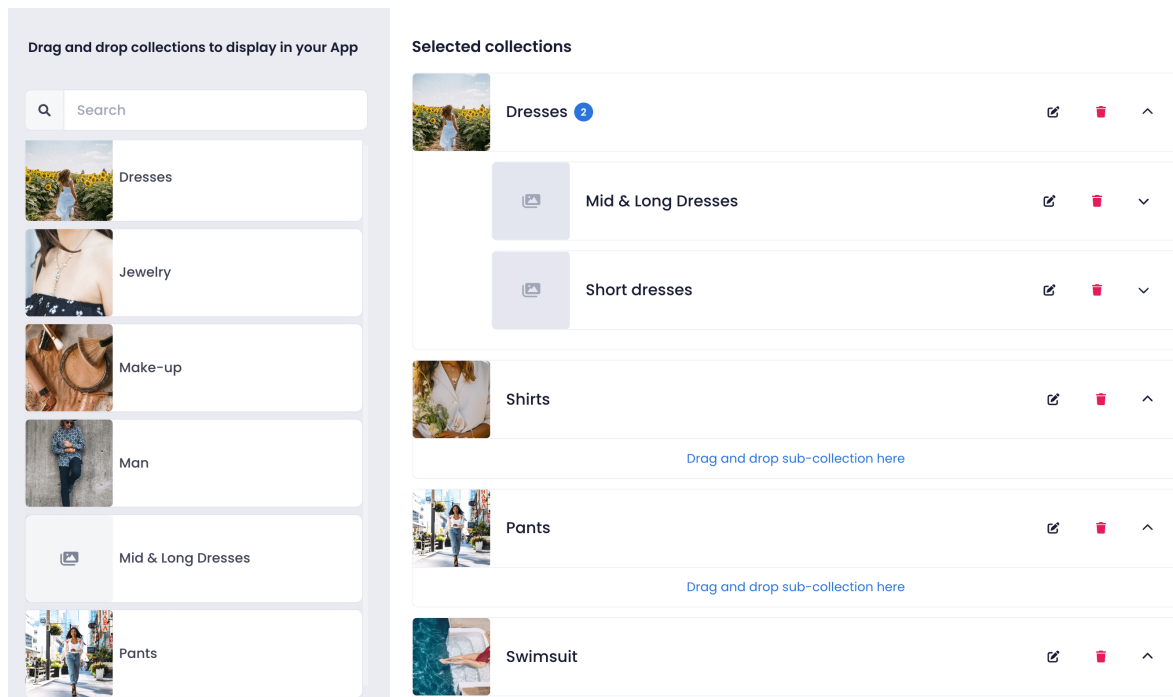

Access the editor from the menu with a click on "Design > Collections" to start the tree configuration.

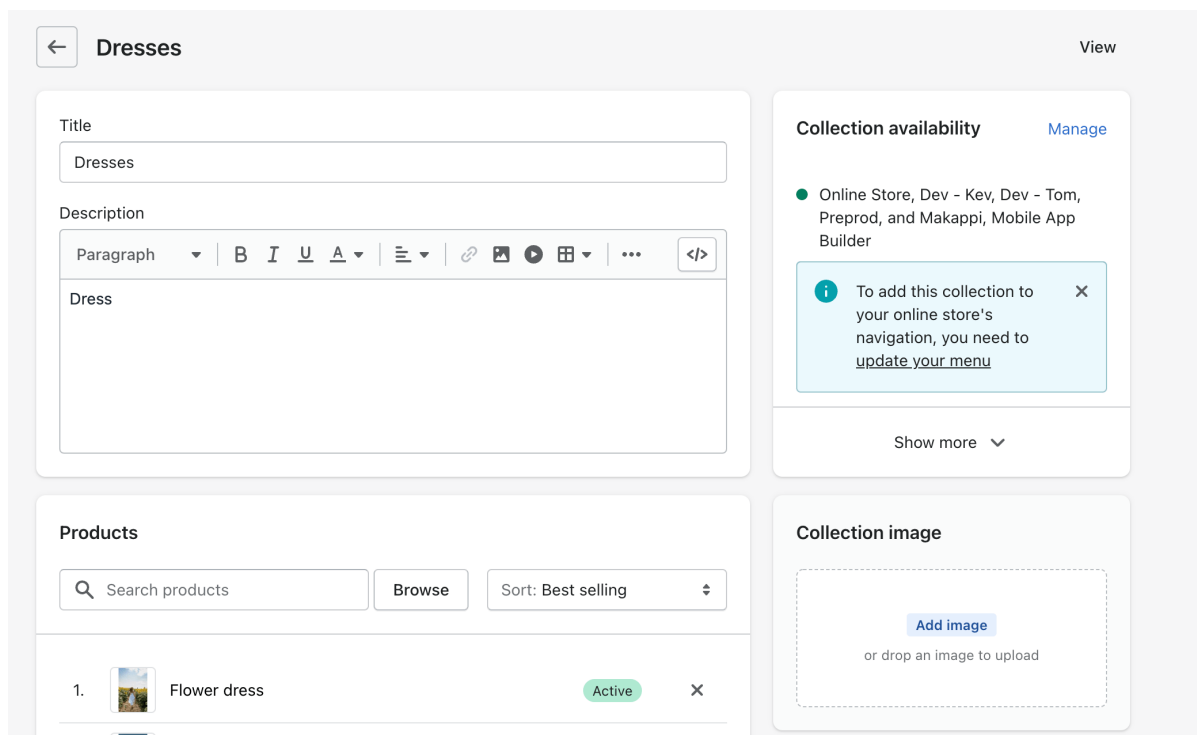

You can search on the left menu for all collections that are configured in your Shopify Dashboard. Drag and drop a collection in the area on the right to add a collection to your Mobile App.

You can change the order by dragging collections in the area on the right.

You can also create a sub-collection by dragging a collection below another collection.

3.2.2 Collection Images

There are two ways to add an image to a collection:

Solution 1: From Shopify Dashboard

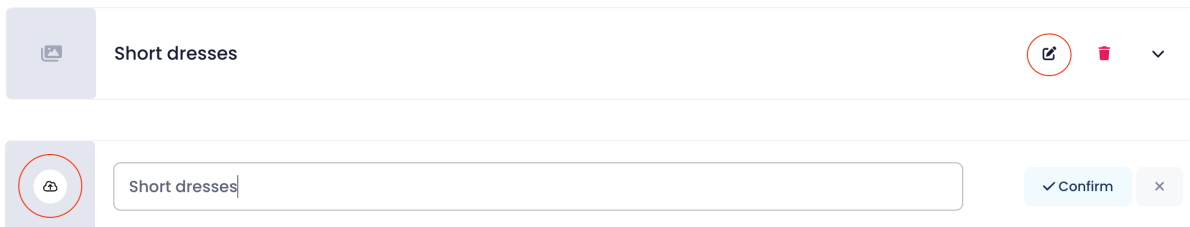

Upload an image to your collection from the Shopify Dashboard. If you change the image later, it will be automatically synced with your App.

1. Open your Shopify Dashboard
2. Click on "Products" then "Collections" in the left menu
3. Click on the Collection
4. Click on "Add image" in the right panel in the section "Collection image"

Solution 2: From Makappi Space

Upload an image to a collection that you previously added to your Mobile App.

1. From your Makappi Space, click on "Design > Collections"
2. In the right panel, edit the collection by clicking on the "Pen" icon
3. Tap on the edit button above the image
4. Select an image
5. Click on "Upload image"
6. Save changes by clicking on "Confirm"
7. To publish all your changes, click on "Publish changes" at the top of the screen

3.3 3. Product

The Product page editor is located in **Design > Product**. It allows you to customize how product pages are displayed in the app.

3.3.1 Default Configuration

By default, the product page has a minimal configuration that includes:

- Product images
- Variants (size, color, etc.)
- Price information

3.3.2 Metafields

You can add metafields to display additional information on each product. Metafield blocks will only show if there is data for the current product.

3.3.3 Integrations

Integrations can add blocks to the product page:

- **Automatic blocks:** Some integrations add blocks automatically, like review integrations (JudgeMe, Stamped, etc.)
- **Optional blocks:** Other integrations enable blocks that can be manually placed on the product page, for example LiveMeUp Shoppables

3.4 4. Menu

The Menu editor is located in **Design > Menu**. It allows you to configure the navigation in the app.

Use the Menu to:

- Add links to important pages like Privacy Policy, Terms of Service, etc.
 - Link to content such as blogs or other pages from your Shopify store
-

3.5 5. Theme

The Theme editor is located in **Design > Theme**.

3.5.1 General Theme

In **Design > Theme > Theme**, you can configure general appearance settings:

- Rounded corners or square corners
- Margins at the border of the screen
- Other layout options

3.5.2 Fonts

In **Design > Theme > Font**, you can select a font or add a custom font.

For custom fonts, the font file needs to be sent by the client, or we can find it from their website and add it to the app.

3.5.3 Colors

In **Design > Theme > Color**, configure the app colors. Usually setting these three is enough:

- **Primary:** The accent color used for buttons, links, etc.
- **Text Color:** The main text color
- **Background Color:** The app background color

The colors should be similar to the web version of the shop.

3.6 6. Store Listings

The Store Listings editor is located in **Settings > App & Store**.

3.6.1 App Settings

Provide the following:

- **App Name:** The name displayed on the user's device
- **App Icon:** A 1024x1024 image file
- **Splashscreen:** The image shown when the app starts

3.6.2 Store Settings

This section contains the information displayed on the App Store and Google Play. The content can usually be copied from the shop's website:

- App description
 - Keywords
 - Screenshots
 - Other metadata
-

3.7 7. Developer Accounts Setup

There are a few steps required to publish the App:

- Create an Apple Developer Account and Google Play account. You will have to pay a \$99 annual fee to Apple and a one time \$25 fee to Google.
- Invite Makappi to both accounts. This is required so we can publish your App.
- There is a validation process on the App Store and the Play Store. Publishing the App can take up to two weeks.

3.7.1 Apple Developer Account

1. Create an Apple Developer account for your company [here](#). You can setup auto-renew to prevent disruption. **Make sure you register as an Organization and not as an Individual. Makappi only works for Organization Accounts.**
2. You will get a call/message from Apple to confirm your enrollment. It can take up to 24h for Apple to process the payment and create your account.

3.7.2 Google Play Console

1. You will need a Gmail account, you can create one [here](#)
2. Your Gmail account needs to have 2-Step Verification enabled. You can do it [here](#)
3. Create a Google Developer account for your company [here](#)

3.7.3 Invite Makappi to your Google Developer Account

Once your Google Account is created you can invite Makappi.

1. Go to the "Users and Permissions" page of your [Google Play Console](#)
2. Click on "Invite new users" and add team@makappi.com with "Admin" privileges
3. In the "Permission" section, click on "Account permissions" then select "Admin (all permissions)" next to App access
4. Tap on "Invite User" in the bottom right of the screen

3.7.4 Invite Makappi to your Apple Developer Account

After your account is created and your payment is processed you will be able to invite Makappi to your Apple Developer Account.

1. Navigate to your [App Store Connect account](#)
 2. Click on "Users and Access" in the top menu bar
 3. Click the "+" button, then add the email team@makappi.com as an Admin with access to all "Additional Resources"
 4. Click on "Invite" to send the invitation
-

3.8 8. App Publication

App publication is handled by Thomas. Once the client has invited us to their developer accounts (see step 7), we can manage everything from their accounts.

3.8.1 Testing Phase

Before going public, we can release test versions:

- **iOS:** TestFlight release for internal testing
- **Android:** Internal release on Google Play

This allows both the client and us to test the app before it goes live.

3.8.2 Public Release

Once the client approves the test version, we submit the app for review:

- Apple and Google have a review process
 - Officially takes 1-2 weeks, but usually much faster
-

3.9 9. App Promotion

Once the app is published, the client should actively promote it to maximize downloads.

3.9.1 Visibility

Add the app everywhere:

- Website footer
- Email footers and newsletters
- Social media profiles
- Order confirmation pages

3.9.2 Incentives

- **App-only promo code:** Offer a discount for the first order from the app (e.g., -10% with code APP10)
- **Early access:** Publish new collections on the app 24h before the website to reward app users

3.9.3 Physical Stores

If the client has a physical shop, use QR codes to promote the app:

- At the checkout counter
- On receipts
- In-store displays

4. Push Notifications

There are two types of notifications: **Campaigns** and **Automatic Push Notifications**.

4.1 Campaigns

Users can create campaigns from the backoffice in **Marketing > Push Notifications**.

4.1.1 Content

Each campaign can include:

- A title and message
- A destination in the app (product, collection, or special page)
- A promo code

4.1.2 Scheduling

Campaigns can be:

- **Sent immediately**
 - **Scheduled for later:** Choose a specific date and time
 - **Sent in user's timezone:** For example, set the notification to arrive at 7pm for all users, regardless of their location
-

4.2 Automatic Push Notifications

Automatic notifications are triggered by user actions. There are three types:

4.2.1 Abandoned Cart

Sent X time after a user adds a product to their cart without completing the purchase.

Example message: "Don't forget! You have [product] in your cart."

This is an extremely powerful notification for recovering sales.

4.2.2 Wishlist Reminder

Sent X days after a user adds a product to their wishlist.

Example message: "Don't forget! You added [product] to your wishlist."

4.2.3 Order Shipped

Automatically connected to Shopify. When an order is marked as shipped, a notification is sent to the user.

Example message: "Your order has been shipped!"

This notification is particularly useful to encourage customers to install the app. At checkout, you can tell them to install the app to be notified when their order ships.

4.3 Klaviyo Integration

When the Klaviyo integration is enabled, the information that a user can receive push notifications is synced to Klaviyo.

This allows for more advanced campaigns:

- **Conditional logic:** If the user has the app, send a push notification; otherwise, send an email
- **Complex scenarios:** Build multi-step flows combining push, email, and SMS
- **Better targeting:** Target users based on behavior, for example:
 - Users who haven't ordered in 6 months
 - Users who previously purchased a specific product
 - Users who browsed a specific collection

5. Integrations

List of available third-party integrations.

5.1 Analytics

- Google Analytics
 - Facebook Analytics
-

5.2 Payment

- Apple Pay
 - Scalapay
 - Alma
 - Klarna
-

5.3 Translation

- Weglot
 - Shopify Translate & Adapt
 - Langify
 - LangShop
-

5.4 Reviews

- Yotpo
 - Judge.me
 - Stamped
 - Société des AVIS GARANTIS
 - Avis Vérifiés
 - Trustpilot
 - Junip
-

5.5 Loyalty & Rewards

- Smile.io
-

5.6 Customer Service

- Gorgias

5.7 Marketing Automation

- Klaviyo
-

5.8 Other

- Back In Stock (notifications)
- Recharge (subscriptions)
- Kiwi Sizing
- Fastoche (returns & exchanges)
- Live Me Up (live shopping)
- Socloz (click & reserve)
- Nosto (merchandising)
- Bloggle (blog builder)

6. FAQ

Frequently asked questions and troubleshooting.

6.1 Frequently Asked Questions
